It currently
* consists of 11 contigs. The true order of the pieces
* is not known and their order in this sequence record is
* arbitrary. Gaps between the contigs are represented as
* runs of N, but the exact sizes of the gaps are unknown.
* This record will be updated with the finished sequence
                                                                                                                                                                                                                                                                                                        ;

~

The invention comprises the amino acid and coding sequence of the Porphyromonas gingivalise dipeptidyleptidase-7 (DPP-7) enzyme. The DPP-7 enzyme has amidolytic activity for cleavage of a peptide bond between the second and third amino acids from the N-terminal end of a target peptide. The DPP-7 target peptide has an aliphatic or aromatic residue as a substituent on the alpha-carbon atom of the second amino acid from the N-terminal end. The DPP-1 protect and DNA sequences of the invention are useful for identifying a DPP-7 inhibitor. DPP-7 inhibitors are useful for reducing the growth of a bacterium and protecting an animal from a periodontal disease caused by Porphyromonas gingivalis (e.g. gingivitis or periodontilis). The present DNA sequence encodes the Porphyromonas of isolated dipeptidylpeptidase useful for identifying inhibitor dipeptidylpeptidase for protecting an animal from periodontal ase caused by Porphyromonas gingivalis or periodontitis). The present DNA sequence encodes the Porphyror gingivalis dipeptidylpeptidase-7 (DPP-7) enzyme of the invention Claim 11; Fig 4; 65pp; English 2002-490075/52 AA015205 P-PSDB; disease Novel the

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                        1920

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         is
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and cell-cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher enkaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention sequences genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (AMBD/J37-AMBD/2012).

The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL10176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                         This invention describes novel genes (I) of the sox (sulphur oxidation) region designated ORF1, ORF2, ORF3 (Open Reading Frame), and soxXXZA from Paracoccus pantotrophus GB17. The proteins (II) encoded by (I) are used for oxidation of reduced sulphur compounds in cellular or cell.-free systems, particularly of thiosulphate to sulphate. (I) is also used for expression of the proteins and to prepare transpenic plants or animals. Or transformed microorganisms. This sequence encodes the ORF2, ORF3 and the soxXXZA proteins from the P. pantotropus sox region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1; sox; ORF1; ORF2; ORF3; soxX; soxY; soxZ; soxA; thiosulphate; transgenic plant; transgenic animal; ds.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and
                                                                                                             The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
 capable of detecting 1000 or more genes from Drosophila. The invention
                                                                                                                                                                                                                                                                           1343 CCATGCTCGATATTGTACGCCGGCGTATCCCTGCCGACAAGCTCCCCGATATATTCAAGA 1402
               useful in developmental biology and in elucidating cell signalling cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLJ6176-ABLJ0511), expressed DNA sequences (ABLJ6175) and the encoded proteins (ABB7737-ABB72072).
                                                                                                                                                                                                                                                                                              1403 ATGTAATCGACAAGAAATTCAAAGGCGACACGAAGAAGTATGCAGACTTCGTATTCGACA

                                                                                                                                                                                                                                                                           ö
                                                          This invention describes novel genes (I) of the sox (sulphur oxidation) region designated ORF1, ORF3 (Open Reading Frame), and soxXXZA from Paracoccus pantotrophus GB17. The proteins (II) encoded by (I) are used for oxidation of reduced sulphur compounds in cellular or cell.-free systems, particularly of thiosulphate to sulphate. (I) is also used for expression of the proteins and to prepare transgenic plants or animals or transformed microorganisms. This sequence encodes the P. pantotropus sox region associated proteins described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or more cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to non-natural variants of a C-terminal fragment of a Plasmodium merozoite surface protein-1 (MSP-1). The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ပွဲ
                                                                                                                                       Gaps
cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins
                                         (ABBS7737-ABB72072).
The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Uthaipibull
                                                                                                                                                                                                                                                      1354 ATTGTACGCCGGCGTATCCCTGCCGACAAGCTCCCCGATATATTCAAGAATGTAATCGAC

The non-natural variants have reduced affinity for at least 1 antibody capable of blocking a second antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2, compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and coding sequence.
cleavage of Plasmodium MSP-1_4_2, and has the same affinity for at least one third antibody that inhibits the proteolytic cleavage of Plasmodium MSP-1_4_2. Compared to natural MSP-1_1_9. The non-natural variants of the present invention are useful for immunising a mammal against malaria, and can be used to treat malaria. The present sequence is the MSP-133

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes a method for generating a repertory of nucleic acids of tuf, fus, atpD and/or recA genes from which probes and/or primers are derived. The method comprises amplifying the nucleic acids of determined algal, archaeal, bacterial, fungal and parasitical species with a combination of defined primer pairs. The method can be used for producing probes and/or primers for detecting one or more related microorganisms e.g. algae, archaea, bacteria, fungi and parasites, for universal detection and for specific and ubiquitous detection and identification of an algal, archaeal, bacterial, fungal and parasitical species, genus, family and group. A nucleic acid (I) obtained using the method of the invention can be used for the universal detection of any bacterium, fungus or parasite in a sample and for the detection of at least one antimicrobial agent resistance gene or at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Nucleic acid sequences are used to generate universal probes and primers which can be used to identify and detect the presence of algal, archaeal, bacterial, fungal and parasitical species in a test sample -

least one toxin gene. hexA nucleic acids are used for the specific and ubiquitous detection and for identification of Streptococcus pneumoniae. (I) can be used to design a therapeutic agent which is effective against microorganisms. Microbial species or genus or family or phylum or group which can be detected include Abiotrophia adiacens, Bordetella sp., Corynebacterium sp., Enterobacteriaceae group, Escherichia coli, Mycobacteriaceae family, Pseudomonada group, Streptococcus sp., Neisseria gonorrhoeae and Staphylococcus sp., Using DNA based tests provides faster results than substrate specificity tests as results can be determined in an hour and improved accuracy is also achieved. AAH00010 to AAH002304 represent nucleotide sequences and primers/probes which are given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           372 TTCCGTGAAGTATCTGCGCAAGATCGTGAAGGTAACGGACAAGGTAGAAGGACAGCTCAA 431

                                                                                   The present invention relates to the genomic sequence of Pyrococcus abyssi and P. abyssi proteins (see AAB96053-AAB96842). P. abyssi is a hyperthermophilic archaeon, which is isolated from deep-sea hydrothermal vents. The present sequence is a fragment of the genomic sequence of P. the proteins of the present invention have various potential industrial uses, since the proteins are stable at very high temperatures, some up to 110 degrees centigrade. The same patent family as WO200065062, which AAH75903-AAH75902 and AAG66436.

Polynucleotides AAC66131-C66139 represent human kidney disease associated genes. Proteins AAV85678-Y85680 represent human kidney disease associated proteins. The polynucleotides have nephrotropic and cytostatic activity. The polynucleotides, encoded proteins and pharmaceutical compositions containing renal disorders such as Bartter's syndrome, treating and preventing renal disorders such as Bartter's syndrome, ditelman syndrome, autosomal dominant polycystic kidney disease and nephrolithiasis. The genes and proteins are also useful for identifying biomolecules that are associated with a specific disease, regulatory pathway, subcellular compartment, cell type, tissue type or species, which is useful in diagnosis, prognosis, treatment and evaluation of therapies for renal diseases for e.g. renal amyloidosis, hypertension, primary aldosteronism, Addison's disease, renal failure, clomerulonephritis, chronic glomerulonephritis, tubulointerstitial nephritis, cronic glomerulonephritis, tubulointerstitial nephritis, cronic disease (PRD), medullary cystic disease, medullary cystic disease (PRD), medullary cystic disease, non-renal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM3642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous system insurable neuropathy and localised neuropathies and central nervous system diseases, such as Alzheimer's, Parkinson's disease, Huntington's disease, amyotrophic lateral sclerosis, and Shy-Drager Syndrome. Other uses include the utilisation of the activities such as: Immune system suppression, and thrombolytic activity, cancer diagnosis and therapy, drug screening, assays for receptor activity, arthritis and inflammation, leukaemias and construction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Note: The sequence data for this patent did not form part of the printed specification.
                                                                                                                                                                                                                                                                        ä
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
